Weakening

By induction on derivations.

Note: When applying Weakening in the induction, check that the left premiss is always a subderivation, and check variable exclusion conditions are satisfied (usually checked elsewhere in the derivation).

Definition 1 (Singleton Depth).

$$SSize : \text{“}\{\kappa\}\text{''} \to \mathbb{N}$$

$$SSize(\kappa_x) = \begin{cases} SSize(\kappa) + 1 & \text{if } \kappa_x = \mathtt{S}_\kappa(\tau) \\ 0 & \text{otherwise} \end{cases}$$

Lemma 14 ($\overset{*}{\equiv>}$-diminution). *If $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L1}$, then $SSize(\kappa_L) > SSize(\kappa_{L1})$*

Proof. By induction on derivations (and transitivity of $>$ on $\mathbb{N}$) $\square$

Lemma 15 ($\overset{*}{\equiv>}$-n+1-nicity). *If $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L1}$ and $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L2}$ where $SSize(\kappa_L) = n{+}1$ and $SSize(\kappa_{L1}) = SSize(\kappa_{L2}) = n$, then $\kappa_{L1} = \kappa_{L2}$*

Proof. By $\overset{*}{\equiv>}$-diminution, $\overset{*}{\equiv>}$-Trans cannot be the last inference of a derivation of $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L1}$ since $SSize(\kappa_1) \geq SSize(\kappa_3) + 2$ (in $\overset{*}{\equiv>}$-Trans). Thus, $\overset{*}{\equiv>}$-1 must have been the last inference. Similarly for $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L2}$, thus $\kappa_{L1} = \kappa_{L2}$ $\square$

Lemma 16 ($\overset{*}{\equiv>}$-stepwise). *If $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L1}$ where $SSize(\kappa_L) = m$ and $SSize(\kappa_{L1}) = n$ and $m > n+1$, then the derivation must contain subderivations of each singleton depth inbetween*

Proof. More precisely this says, where $m > n$ by $\overset{*}{\equiv>}$-diminution, the derivation must contain subderivations of each $\Delta;\Phi \vdash \kappa_i \overset{*}{\equiv>} \kappa_j$ where $m \geq i > j \geq n$, $SSize(\kappa_k) = k$ when $m \geq k \geq n$, $\kappa_m = \kappa_L$, $\kappa_n = \kappa_{L1}$.
By induction on derivations (base case is where $m = n+2$, which necessitates a last inference of $\overset{*}{\equiv>}$-Trans. Each premiss must have SSize difference of 1, fulfilling hypothesis) $\square$

Lemma 17 ($\overset{*}{\equiv>}$-$m+n$-nicity). *If $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L1}$ and $\Delta;\Phi \vdash \kappa_L \overset{*}{\equiv>} \kappa_{L2}$ where $SSize(\kappa_L) = m+n$ and $SSize(\kappa_{L1}) = SSize(\kappa_{L2}) = n$, then $\kappa_{L1} = \kappa_{L2}$*

Proof. By $\overset{*}{\equiv>}$-stepwise and $\overset{*}{\equiv>}$-$n+1$-nicity when $m > n+1$.
By $\overset{*}{\equiv>}$-$n+1$-nicity when $m = n+1$.
No other cases by $\overset{*}{\equiv>}$-diminution. $\square$

Theorem 18 ($\overset{\text{norm}}{\equiv>}$-Unicity). *If $\Delta;\Phi \vdash \kappa_L \overset{norm}{\equiv>} \kappa_{L1}$ and $\Delta;\Phi \vdash \kappa_L \overset{norm}{\equiv>} \kappa_{L2}$, then $\kappa_{L1} = \kappa_{L2}$*

Proof. (this is a really quick sketch)
All $\overset{\text{norm}}{\equiv>}$ rules have $\overset{*}{\equiv>}$ premiss with rhs singleton depth 1. By $\overset{*}{\equiv>}$-$m+n$-nicity, where $n = 1$. $\square$

Theorem 19 ($\overset{\blacktriangleright}{\Pi}$-Unicity). *If $\Delta;\Phi \vdash \tau_L \overset{\blacktriangleright}{\Pi} \kappa_{L1}$ and $\Delta;\Phi \vdash \tau_L \overset{\blacktriangleright}{\Pi} \kappa_{L2}$, then $\kappa_{L1} = \kappa_{L2}$*

Proof. (this is a really quick sketch)
By unicity of $\overset{\text{norm}}{\equiv>}$. $\square$

Theorem 20 (PK-Unicity). *If $\Delta;\Phi \vdash \tau_L ::> \kappa_{L1}$ and $\Delta;\Phi \vdash \tau_L ::> \kappa_{L2}$, then $\kappa_{L1} = \kappa_{L2}$*

Proof. (this is a really quick sketch)
As PK is syntax directed, proof is by inspection for all rules except PK-λ (variables in contexts are unique– see context rules), which is by induction on derivations, and PK-Ap, which requires of unicity of $\overset{\blacktriangleright}{\Pi}$ (above theorem). $\square$

Theorem 21 (PK-Principality). *If $\Delta;\Phi \vdash \tau ::> \kappa_1$ and $\Delta;\Phi \vdash \tau{::}\kappa_2$, then $\Delta;\Phi \vdash \kappa_1 \lesssim \kappa_2$*

Proof. From definition of $\Delta;\Phi \vdash \tau{::}\kappa$ and CSK-SKind $\square$

Theorem 22 (why is this here?). *If $\Delta;\Phi \vdash \kappa_1 \lesssim \mathtt{S}_{\kappa_2}(\tau)$, then $\Delta;\Phi \vdash \kappa_1 \lesssim \kappa_2$*
